

2、工程编译方法

使用 IAR 打开工程文件: GSM-->Project-->GSM.eww, 打开后如下图所示,

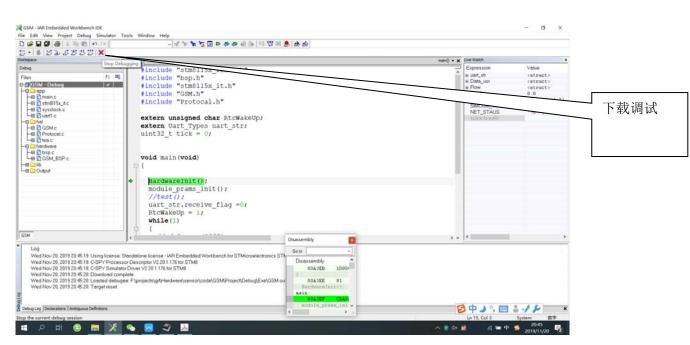

点击下载调试按钮, 烧录代码

按下图点击后重新回到下载界面烧录下一个电路板,以此类推。

3、修改产品 id

```
#include "stm8l15x.h"
#include <string.h>
#include "AT_CMD.h"
#include "GSM.h"
#include "String.h"
#include "stdlib.h"

#define Network_Thres 30

//unsigned char Establish_TCP_Connection[100]="AT+CIPSTART=\"TCP\",\"15k801n729.iok.la\",36732\r";
//unsigned char one_net_key[]="*284261#abab#json*";
unsigned char one_net_key[]="*284261#abab#json*";
unsigned char Establish_TCP_Connection[100]="AT+CIPSTART=\"TCP\",\"dtu.hecluds.com\",1811\r";
```

鉴权码可以设置为 id 号这样方便设置和管理,需要和服务端保持一致
